IREC Workshop: Experience on Net-Zero Energy Buildings

Palau Robert, Barcelona, Spain

October 3, 2012

Josef Ayoub

Operating Agent

Achieving a Sustainable Energy Future in Buildings

- Energy use in buildings **worldwide** accounts for over 40% of primary energy use and 24% of greenhouse gas emissions (*Promoting Energy Efficiency Investments, IEA, Paris. 2008*)
- Simply **increasing energy supply will not solve** the current energy supply and security situation and associated environmental problems.
- Given the challenges related to climate change and resource shortages, making residential and non-residential buildings **more energy- and resource-efficient while maintaining thermal comfort and cost-effectiveness** represents and enormous opportunity to save money and reduce pollution
- Radical improvements in the energy performance and use of renewables in buildings are required

Source: NREL, 2011

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

- Currently, a prominent vision proposes so called “net zero energy” (USA), “net zero carbon” (UK) or “EQuilibrium” buildings (Canada)

- A maze of definitions

- | | |
|-------------------------------|----------------------------|
| 1. Low energy house | 10. Zero carbon house |
| 2. High performance buildings | 11. Emission free house |
| 3. Energy saving house | 12. Carbon free house |
| 4. Ultra low energy house | 13. Energy self sufficient |
| 5. Zero energy house | 14. BREEAM building |
| 6. Zero energy buildings | 15. EQuilibrium house |
| 7. Passive house | 16. Green building |
| 8. Zero heating energy house | 17. Very low energy house |
| 9. Plus energy house | 18. Climatic active house |

- Although these terms have different meaning and are poorly understood, several IEA countries have adopted this vision as a long-term goal of their building energy policies – EPBD Recast (2010) – 71 definition to-date.

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

European Parliament on Zero Energy Building Regulation

- In connection to revision of Energy Performance of Buildings Directive (EPBD which came into force in 2003) the Parliament stated:
 - By 31 December 2018 at the latest EU Member States must ensure that all newly-constructed buildings produce as much energy as they consume on-site - e.g. via solar panels or heat pumps
 - Parliament also wants Member States to set intermediate national targets for existing buildings, i.e. to fix minimum percentages of buildings that should be zero energy by 2015 and by 2020 respectively
 - Members define zero-energy buildings as *"where, as a result of the very high level of energy efficiency of the building, the overall annual primary energy consumption is equal to or less than the energy production from renewable energy sources on site"*

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Examples from Europe

Zero Energy or Plus, Germany

*Solar Siedlung Vauban Freiburg,
Germany*

Low energy buildings – 15 kWh = 4.75 kBtu per ft² per year.

Large solar photo PV systems.

Feed in tariffs guaranteed by German government.

These buildings produce much more than they use!

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Passive House Technology

Frankfurt/M Germany Sophienhof
FAAG/ABG Frankfurt Architect Fuessler

160 dwellings

14 767 m²

15 kwh / m² per year = 4.75 kBtu

Extra costs

= 3-5% of the total costs

Payback = 9 – 10 years

Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Step-wise approach in Denmark

Demand in Danish Building Codes

Gross energy including heating, cooling ventilation
and hot sanitary water

- Introduced in Parliament 2008
- Zero in 2030
- Plus Energy 2040

The way forward

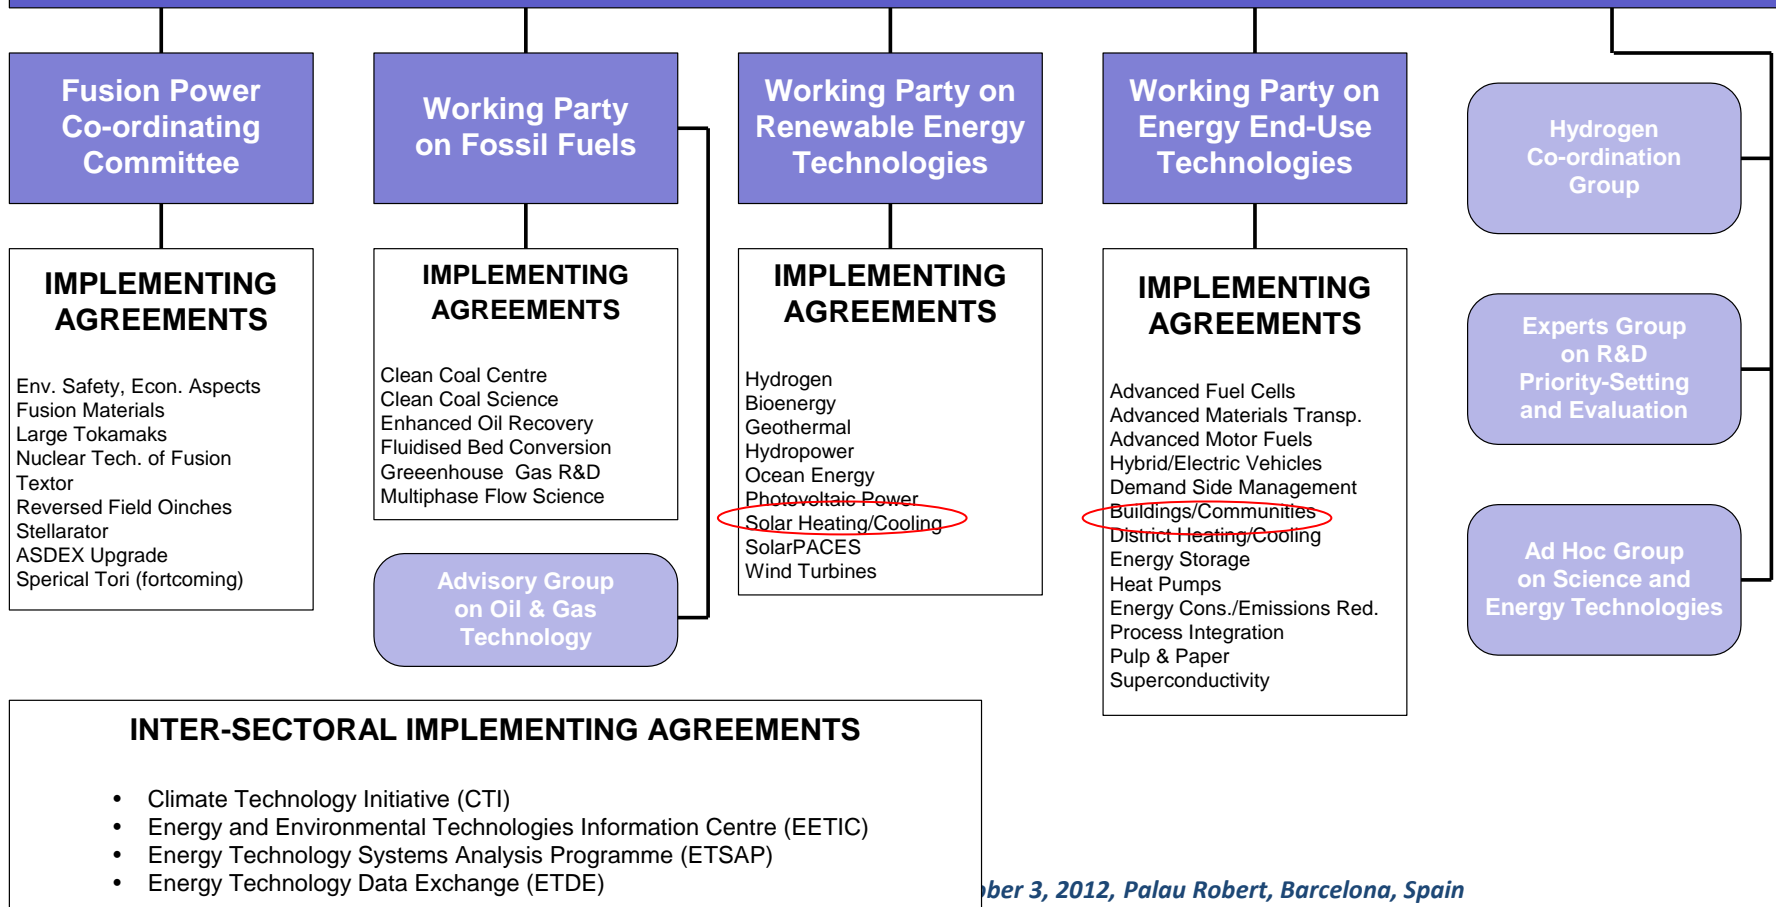

- What is missing is a **clear understanding of definitions and international agreement on the measures of building performance** that could inform “zero energy” building policies, programs and industry adoption.

Annex 52/Task 40 Overview

- **Objective:** To provide a clear definition and international agreement on the measures of building performance that could inform “zero energy” building policies, programs and industry adoption
- **Scope:** Residential, non-residential, clusters, different climates.
- **Means:**

- **Subtask A:** Definitions and Implications
- **Subtask B:** Design Processes and tools
- **Subtask C:** Solution Sets (Adv. Design, Eng., Tech.)
- **Subtask D:** Dissemination and Outreach

● **Period: Oct. 2008 – Sept 2013**

Our vision:

A world in which buildings
consume zero net energy

Towards Net Zero Energy Solar Buildings **TASK 40/ANNEX 52**
<http://www.iea-shc.org/task40>

R&D work program

Subtask	Leaders	Objective	Sub-activities
A: Definitions & Implications	K. Voss (DEU) R. Lollini (ITA) [A. Napolitano, ITA, Withdrew Fall 2011]	<i>to establish an internationally agreed understanding on NZEBs based on a common methodology</i>	A1: NZEB Definitions framework A2: Monitoring, verification & compliance A3: Grid interaction
B: Design Processes & Tools	A. Athienitis (CAN) L. O'Brien (CAN) [A. Hirsch, USA, downgraded level of effort Fall 2011]	<i>to identify and refine design approaches and tools to support industry adoption of innovative demand/supply technologies for NZEBs</i>	B1: Document processes and tools currently being used to design NZEBs and under development by participating countries B2: Select/refine pre-concept design, feasibility tools linked to STC Solution Sets (primarily rolled into B1) B3: Develop tools guide, worked examples of projects to support industry adoption (Source Book Vol. 2)
C: Solution Sets (Advanced Design Engineering, Technologies)	F. Garde (FRA) M. Donn (NZL)	<i>to develop and test innovative, whole building net-zero solution sets for cold, moderate and hot climates with exemplary architecture and technologies that would be the basis for demonstration projects and international collaboration</i>	C1: NZEB STC Database C2: Analysis Matrix C3: Research Analysis of themes undertaken C4: Vol. 3 STC Source Book of Solution sets
D: Dissemination & Outreach	OA / All National Experts	<i>to support knowledge transfer and market adoption of NZEBs on a national and international</i>	D1: ANNEX/Task webpage, Database D2: Prepare/Disseminate Vols. 1, 2, 3 D3: Establish PhD network D4: Outreach (workshops, conferences, other)

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

R&D work program

Task 40/Annex 52: Towards Net Zero Energy Solar Buildings (NZEBs)			Lead Country: Canada Operating Agent: Josef Ayoub		
Objective	The objective of the task is joint international research to advance NZEBs to practical reality in the marketplace by developing a common understanding and methodology, guidelines, tools and innovative solution sets and a source book that would be the basis of national demonstrations that would support broader industry adoption.				
Scope	The scope includes new and existing buildings (residential and non-residential initially), clusters of buildings and small settlements for the different climates (cold, moderate and hot) of participating countries. The work focuses on an analysis of existing examples and the development of optimized, innovative whole building solutions that will be the basis of advanced, practical demonstrations, with exemplary architecture, that aim to equalize their small remaining annual energy needs by building integrated heat or power generation in combination with the interaction with utility structures.				
Subtasks	A Methodologies, Analysis & Implications	B Technology, Simulation & Tools	C Advanced Building Design & Engineering		D Dissemination Activities
			C1 Non-Residential Concepts	C2 Residential Concepts	
Lead country/STL Co-Lead	Germany: Karsten Voss Italy: Assunta Napolitano	USA: Paul Torcellini Canada: Andreas Athienitis	NZL: Michael Donn France: François Garde	TBD	All: Subtask Leaders Committee
Subtask Objectives	To develop an international definition and understanding of NZEBs based on a common methodology that considers large-scale implications, credit systems for grid interaction (heat, cool, power) and relevant ISO/CEN standards.	To identify and investigate innovative demand/supply technologies, to simulate impacts on buildings and to produce a suite of NZEB tools and database to support industry adoption.	To develop innovative, whole building net-zero solution sets for cold, moderate and hot climates with exemplary architecture that would be the basis for national demonstration projects; to document NZEB design options in terms of market application and lifecycle energy and CO2 implications; and to develop guidelines and tools for industry adoption of integrated designs and concepts		To support knowledge transfer and market adoption of NZEBs on a national and international level
Means	The review and analysis of existing NZEBs definitions (site / source energy, exergy, emissions, costs, etc.) with respect to the demand, the supply, the grid interaction and the mismatch.	A technology focused review of existing NZEB concepts for cold, moderate and hot climates and identification of technological improvements considering sustainability, economy and future prospects.	Documenting and analyzing existing NZEBs, benchmarking with near NZEBs and other very low energy buildings (new and existing) and undertaking lifecycle assessment and optimization studies with respect to material/resource use and technologies for participating countries.		Establishing an NZEB web page, within the IEA SHC framework, and an NZEB database that can be expanded and updated with the latest projects and experiences.
	Analysis of the energy, emission and energy cost balance for existing NZEBs and near zero buildings.	Investigation of advanced building integrated passive (incl. shading), active solar system concepts and cogeneration technologies (micro CHP) for warm, moderate and cold climates.	Development of advanced integrated design and engineering solutions, including shading systems for control of solar gains, in close cooperation with builders, planners, manufacturers and clients that would lead to the development of practical demonstration projects.		Producing a NZEB source book including example buildings from all investigated building types and climates.
	A study on the grid interaction (power/heat/cool) and analysis of the time dependent energy mismatch.	Investigation of advanced storage (heat/cool electricity) and integration with utility grids as well as advanced controls and load management technologies.	Developing typical NZEB solution sets with respect to building types and cold, moderate and warm climates and to document design options in terms of market application and lifecycle energy and CO2 implications		Establishing an education network for student, summer schools and contributions to the Solar Decathlon and similar activities.
	The development of a harmonized NZEB methodology and definition based on experience from existing approaches and relevant CEN/ISO standards	Detailed simulations of these innovative technologies in connection with building energy loads, solar gain control, energy storage, controls and utility grids.	With Subtask B, develop NZEB projects that integrate engineering solutions and exemplary architecture - in close cooperation with architects, builders, planners, manufacturers, clients and utilities – as the basis for national demonstrations projects.		Workshops, articles and features in industry magazines to stimulate market adoption.
	The development of a monitoring and verification concept for checking the annual balance in practice (energy, emissions, costs).	The development of simplified NZEB tools or interfaces (e.g. spreadsheet or web-based method) linked to a national / international database of building archetypes and technologies.	With Subtask B, develop tools, guidelines and case studies for architects, engineers, manufacturers and clients to support the market adoption of practical, integrated NZEB concepts.		The transfer of task outputs to national policy groups, industry associations, utilities, academia and funding programmes.
Results	Harmonized methodology, definition and monitoring and verification guide (report)	Overview of market available and near market components and systems for different building types and climates.	Best practices, case studies, design guidelines, tools and knowledge for the task sourcebook and database and other dissemination materials.		NZEB source book covering the methodology, technologies, tools, case studies and demonstration projects.
	Study of the technical potential of NZEBs including impacts on grids (report).	A suite of NZEB tools including a data base and user manuals.	Solution sets and designs for national demonstration projects.		NZEB web page and database, papers, special issues of industry magazines.
Dissemination	Dissemination is organised as a shared responsibility of all subtasks				

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Task/Annex Member countries

Australia	New Zealand
Austria	Norway
Belgium	Portugal
Canada	Singapore
Denmark	S. Korea
Finland	Spain
France	Sweden
Germany	Switzerland
Italy	UK
	USA

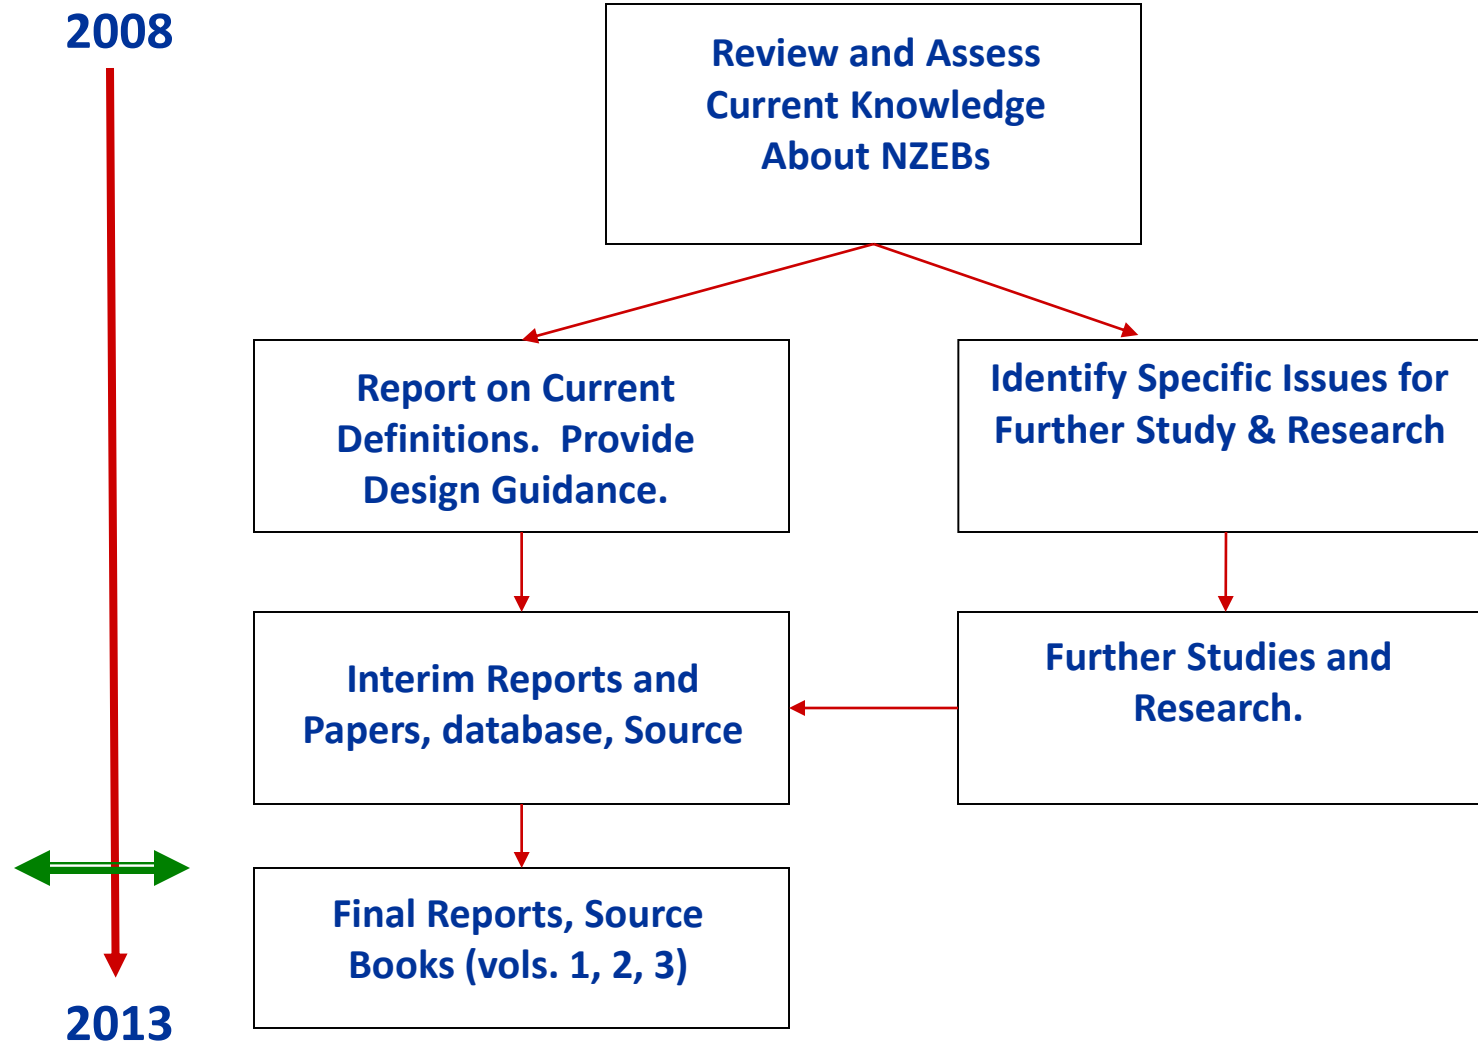

- Between 55 – 60 experts + 15 or so regular participants and contributors
- 90% universities/academia (professors, PhD students)
- National labs (NREL, CanmetENERGY, EURAC, AEE)
- Industry (Samsung, GROCON, others)

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Task 40/Annex52 flowchart

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Planned outputs/deliverables

- Source book (s) targeting specific groups such as national policy, industry and industry associations, utilities, academia, funding programs
 - Vol. 1 - Definition and Methodologies (STA – DEU/ITA)
 - Vol. 2 - Design Tools and Processes (STB – Canada/US)
 - Vol. 3 – Case Studies (France, Canada)
- Databases of over 100 case studies from 19 countries and different climatic conditions
- Stand-alone technical reports, conference papers
- An education network (professional development courses, training material)
- Website (“NZEB Knowledge Centre”)

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

What is known about achieving “zero” in buildings?

Ideas coalescing on a Typical Methodology

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Pogharian/Ayoub

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Towards net-zero energy

BUILDING SYSTEMS	CURRENT BUILDINGS	FUTURE SMART NET-ZERO ENERGY BUILDINGS
Building fabric	Passive, not designed as an energy system	Optimized for passive design and integration of active solar systems
Heating & Cooling	Large oversized systems	Small systems optimally controlled; integrated with solar, CHP; Communities: seasonal storage and district energy
Solar systems /renewables	No systematic integration – an after thought	Fully integrated: daylighting, solar thermal, PV, hybrid solar, geothermal systems, biofuels
Building operation	Building automation systems not used effectively	Predictive control to optimize comfort and energy performance; online demand prediction

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Subtask A: Definitions - Approach

Net Zero **Site Energy** Building

A site ZEB produces at least as much energy as it uses in a year, when accounted for at the site.

Net Zero **Source Energy** Building

A source ZEB produces at least as much energy as it uses in year, when accounted for at the source.

Net Zero **Energy Costs** Building

In a cost ZEB, the amount of money the utility pays the building owner equals to the amount the owner pays the utility

Net Zero **Energy Emissions** Building

A net-zero emissions building produces at least as much emissions-free renewable energy as it uses from emissions-producing energy sources

Net-Zero **Energy** Home/ Zero Net **Energy** Building

Energy consumption = energy production (grid connection)

Net-Zero **Exergy** Building

Both quantity and quality of energy is taken into consideration

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Net-Zero **Carbon** Building/Zero **Carbon** Building

CO₂ free energy use.

Towards Net Zero Energy Solar Buildings TASK 40/ANNEX 52

<http://www.iea-shc.org/task40>

Definitions - Energy supply system

- **Off-grid/self sufficient/ autonomous building**

Zero Stand Alone Buildings are buildings that do not require connection to the grid or only as a backup. Stand alone buildings can autonomously supply themselves with energy, as they have the capacity to store energy for night-time or wintertime use

- **On-grid/grid-connected building**

Zero Net Energy Buildings are buildings that over a year are neutral, meaning that they deliver as much energy to the supply grids as they use from the grids. Seen in these terms they do not need any fossil fuel for heating, cooling, lighting or other energy uses although they sometimes draw energy from the grid

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

STA: Definition Framework

Subtask B: Design Process & Tools

- Access to data on technologies and design methodology to give better models

What is the appropriate **model resolution** for each stage of the design?

What is **the role of simple spreadsheet-based tools** (e.g., RETScreen and PHPP) versus more advanced **detailed simulation**?

What other tool **capabilities are needed to model new technologies** such as building fabric-integrated storage (PCMs), BIPV/T?

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

A detailed look at the design process and tools from real projects to draw general lessons

Framework

1. Document the following:
 - the design process
 - which modeling tools were used and how
 - notable features of each building
 - gaps of existing tools in designing NZESBs.
 - building energy use and comfort
2. Study accuracy of modeling tools and use calibrated energy models to analyze building performance
3. Explore opportunities for cost reduction or further energy reduction using optimization tools.

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Case Studies selected

1) EcoTerra House, Eastman
(near Montreal), Canada

2) EnerPos, Saint-
Pierre, Reunion
Island, France

3) NREL Research Support
Facilities (RSF), Golden, USA

4) Leaf House, Angeli di
Rosara, Italy

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

EcoTerra™ EQuilibrium House

Demonstration Project

2.8-kW Building-integrated PV-thermal system

Passive solar design:
Optimized triple glazed windows and thermal mass

Ground-source heat pump

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

Passive design and integration with active systems

Near net-zero house; a higher efficiency PV system covering same area would result in net-zero.

Study of occupancy factors indicated importance of controls.

EcoTerra energy system

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

BIPV – integration in EcoTerra

- **Building integration:** integration with the roof (envelope) and with HVAC
- **BIPV/T** – (photovoltaic/thermal systems): heat also recovered from the PV panels, raising overall solar energy utilization efficiency
- **Heat recovery** may be open loop with outdoor air or closed loop with a circulating liquid; possibly use a heat pump

IREC Workshop: Experiences on Net-Zero Energy Buildings, October 3, 2012, Palau Robert, Barcelona, Spain

BIPV/T roof construction in Maisons Alouettes factory as one system – a major Canadian innovation
